# Starfish!

## FACT SHEET

Starfish are invertebrates  
(animals with no bones).

Sunflower Sea Star, Basket Star, Crown of Thorns Sea Star, and Sun Star are just a few kinds of starfish.

### Diet:

Starfish eat plankton, algae, sponges, snails, and other small animals.

Habitat: Starfish live in the ocean.

Starfish have tiny microscopic eyes at the top of each arm.

Most starfish have five arms, but some species have up to 40!

Starfish can shed arms and grow new ones to replace them.

Starfish have bony skin which protects them from predators.

Starfish can move using hundreds of tube feet located on their underside.
